Problem Statement - 40

Problem statement – Network Intrusion Detection (NIDS)

The Challenge:

Create a robust network intrusion detection system (NIDS) using machine learning. The system should be capable of analyzing network traffic data to identify and classify various types of cyber-attacks (e.g., DoS, Probe, R2L, U2R) and distinguish them from normal network activity. The goal is to build a model that can effectively secure communication networks by providing an early warning of malicious activities.

Objectives of the Network Intrusion Detection System (NIDS)

To develop a machine learning-based Network Intrusion Detection System (NIDS) that can monitor network traffic, detect malicious activities, classify different types of cyber-attacks, and distinguish them from normal network behavior in real time.

Specific Objectives

- 1. Collect and preprocess network traffic data to remove inconsistencies, handle missing values, and prepare the dataset for machine learning algorithms.**
- 2. Analyze network traffic patterns and identify features that are useful for distinguishing normal traffic from intrusion attempts.**
- 3. Build and train machine learning models capable of detecting network intrusions with high accuracy.**
- 4. Classify different categories of cyber-attacks, including Denial of Service (DoS) , Probe Attacks , Remote-to-Local (R2L) Attack**
- 5. Visualize detection results and attack statistics through dashboards or reports for easier monitoring and analysis.**
- 6. Provide early warning and alert generation when suspicious or malicious network activities are detect**

Technology Used

Tech Stack (Mandatory)

Use **any one** of the following approaches:

- LangFlow + IBM watsonx.ai + Granite Models
- IBM Cloud Agentic Lab with IBM Granite Models
- Replicate with LangChain + RAG + IBM Granite Models
- Machine-learning tool

I used Machine-Learning-Tool+ IBM watsonx.ai + Granite Models

Proposed Solution -

Proposed Solution: Network Intrusion Detection (NIDS)

The proposed solution is to develop a Machine Learning-based Network Intrusion Detection System (NIDS) using IBM Watsonx.ai and the Kaggle Network Intrusion Detection Dataset. The system will analyze network traffic data, preprocess and extract important features, and train a machine learning model to identify suspicious activities. It will classify network traffic into Normal, DoS, Probe, R2L, and U2R categories. The trained model will continuously monitor network traffic and generate real-time alerts when malicious behavior is detected. By using IBM Watsonx.ai, the solution aims to provide accurate, efficient, and automated cyber-attack detection, helping organizations improve their network security and protect against potential threats.

Machine-Learning component Used -

1) **IBM Cloud** – It provides the infrastructure to build, deploy, and scale the **Network Intrusion Detection (NIDS)** tool. IBM Cloud enables a **reliable, secure, and scalable environment** for deploying the network detection tool

2) **IBM watsonx AI Agent** - Processes user input to predict the **Network Intrusion Detection** using given data set

3) **File component** - Stores and retrieves user data , protocol , services , flags , etc for network detection datasets for analysis and tracking.

4) **Pipeline component** – for the deployment of the machine learning tool pipeline component is used

Network Intrusion Detection System (NIDS)

Novelty and Uniqueness

- Uses IBM Watsonx.ai to build a cloud-based Machine Learning Network Intrusion Detection System (NIDS).
- Detects both known and unknown cyber threats by learning network traffic patterns.
- Classifies multiple attack types (DoS, Probe, R2L, and U2R) along with normal network traffic.
- Provides real-time intrusion detection and early warning alerts.
- Reduces false positives and false negatives through optimized feature selection and model training.
- Combines automation, scalability, and intelligent threat detection in a single solution.
- Easily adaptable to new and evolving cyber-attack techniques, making it suitable for modern network security environments.

Future Scope

Algorithms Used

- 1. Random Forest**
- 2. XGBoost (Extreme Gradient Boosting)**

Future Scope

- 1. Real-Time Deployment:** Integrate the model with live network monitoring systems to detect and prevent cyber-attacks in real time.
- 2. Advanced AI Integration:** Incorporate Deep Learning and Artificial Intelligence techniques to improve detection of zero-day attacks and emerging cyber threats with higher accuracy.

Thank You!

Thank you for your time and interest.
